Serial No.: 10/529,500
Docket No.: 28955.1047

IN THE CLAIMS:

1. (Currently Amended) An organic electroluminescent display comprising:
a supporting substrate;
an organic electroluminescent element;
a first passivation layer;
an intermediate layer;
a second passivation layer;
a color conversion layer for adjusting and/or converting the color of a light emitted from
the organic electroluminescent element; and
a transparent substrate formed in sequence.
2. (Original) An organic electroluminescent display according to claim 1, wherein
the following formula is satisfied,
$$0.001 \mu\text{m} < T1+T2 < 200 \mu\text{m}$$

wherein T1 is the film thickness of the first passivation layer, and T2 is the film thickness of the
second passivation layer.
3. (Cancelled)
4. (Original) An organic electroluminescent display according to claim 3, wherein
the intermediate layer comprises an inert fluid.

Serial No.: 10/529,500
Docket No.: 28955.1047

5. (Original) An organic electroluminescent display according to claim 1, wherein the color conversion layer comprises a fluorescent medium.

6. (Currently Amended) A process for producing an organic electroluminescent display, comprising:

arranging an organic electroluminescent element and a first passivation layer on a supporting substrate to form a first substrate;

arranging a color conversion layer for adjusting and/or converting the color of a light emitted from the organic electroluminescent element, and a second passivation layer on a transparent substrate to form a second substrate; and

attaching the first substrate to the second substrate with an adhesive such that the first passivation layer faces the second passivation layer with an adhesive layer therebetween.

7. (Cancelled)

8. (New) An organic electroluminescent display comprising:

a supporting substrate;

a thin film transistor;

an organic electroluminescent element;

a first passivation layer;

Serial No.: 10/529,500
Docket No.: 28955.1047

a second passivation layer;
a color conversion layer for adjusting and/or converting the color of light emitted from the organic electroluminescent element; and
a transparent substrate formed in sequence;
the second passivation layer being formed of a transparent inorganic material.

9. (New) An organic electroluminescent display according to claim 8, wherein the first passivation layer is formed of a transparent inorganic material.

10. (New) An organic electroluminescent display according to claim 8, wherein the following formula is satisfied,

$$0.001\mu\text{m} < T1+T2 < 200\mu\text{m}$$

wherein T1 is the film thickness of the first passivation layer, and T2 is the film thickness of the second passivation layer.

11. (New) An organic electroluminescent display according to claim 8, further comprising an intermediate layer between the first passivation layer and the second passivation layer.

12. (New) An organic electroluminescent display according to claim 11, wherein the intermediate layer comprises an inert fluid.

Serial No.: 10/529,500
Docket No.: 28955.1047

13. (New) An organic electroluminescent display according to claim 8, wherein the color conversion layer comprises a fluorescent medium.

14. (New) The process according to claim 6, additionally forming a TFT, organic electroluminescent element, and first passivation layer on the first substrate.
